PROBLEM SOLVING

problem

thinking

solution

Traditional parking can be challenging and sometimes lead to collisions

The need arises to:

- Avoid parking crashes by using automatic parking
- Detect available parking slots accurately
- Safely guide the vehicle into the parking slot

Our innovative approach involves integrating cutting-edge technology:

- Utilizing ESP32 CAM and Android camera modules
- Implementing advanced image processing and object detection techniques

We provide a comprehensive solution by enabling autonomous parking:

- Real-time instructions sent to an electric car
- Empowering the vehicle to navigate and park autonomously within designated parking areas

A conceptual image featuring a blue banner with the word "Solution" in white, and a pair of glasses with "Problem" written on the lens. The banner is on the left, and the glasses are on the right, with the lens overlapping the banner's edge.

Solution

Problem

Step 1

Scan car kit environment space:

Our system initiates by scanning the environment around the car kit and employs a camera to create a digital map of the surroundings

Step 2

Detect objects in space:

Our cutting-edge image processing and object detection techniques come into play

The system identifies borders, parking slots, and the car position

Step 3

Move car autonomously to the parking slot:

Leveraging real-time data and computations, the car autonomously navigates to the designated parking slot

Step 4

Successfully parking:

The final step involves skillfully maneuvering the car into the parking slot, With our system's guidance, parking is completed successfully, avoiding collision and errors

How It Works

Flow Of Operations

Scan current state

Parse to grayscale matrix

2	3	2	2	1	1
19	15	6	7	10	4
68	46	8	27	25	26
115	67	26	40	32	27
170	120	67	63	40	26
220	200	150	112	66	48

Objects detection using OpenCV

Parse to system data structure matrix

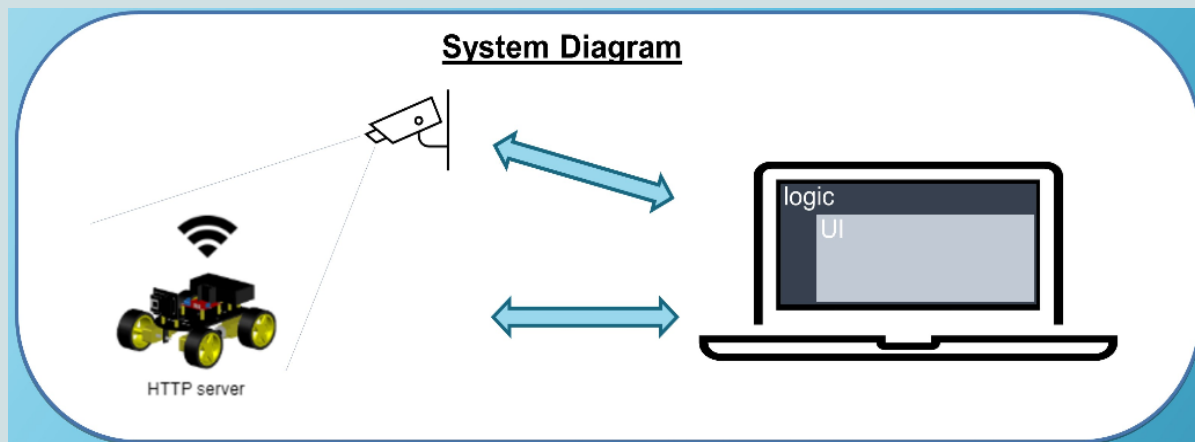

1	1	1	1	1	1
2	2	3	1	1	1
2	2	3	1	1	1
1	1	1	1	1	1
0	0	0	4	4	4
0	0	0	4	4	4

Send moving orders to the RC car

HTTP server

How It Works

Other solutions can be made such as:

- **Guiding Car Between Lines:**
Utilizing proximity sensors and predefined algorithms to navigate the car between designated parking and driving lines
- **Onboard Car Camera (POV):**
Installing a camera directly on the car to provide a Point-of-view perspective during parking maneuvers
- **Incorporating Sensors or Indicators:**
Implementing additional sensors or indicators around the parking area to assist in detecting and guiding the car
- **Autonomous Valet Parking (AVP):**
Implementing a more comprehensive autonomous valet parking system, where the car can park itself and return to the driver when summoned

*We appreciate your time and interest in our
Autonomous Car Parking System project.*

*Our journey doesn't end here. Feel free to
reach out with questions or explore further
collaborations.*
